UCM2000 Upgrade Kit

Worried about obsolescence? Require justification to upgrade?

The new UCM2000 SEW Servodrive Upgrade Kit not only gives peace of mind, it also provides a host of software features which will enhance your existing machine.

Inevitably, as with all technological advancements, the original SEW Servo Drive installed on the UCM2000 range of machines has become obsolete. Consequently spares and replacements for the drive have become scarce and AEM have now exhausted their supply.

There are two options available:

Option 1: Conduct a lengthy repair of the failed drive resulting in loss of production and high costs associated with the repair at the manufacturer's facility. Even this eventually will become problematic due to specific component obsolescence with an outcome of spending good money after bad.

Alternatively you could choose-

Option 2: Purchase the UCM IPOS SEW drive upgrade kit which will not only provide you with the peace of mind synonymous with a new SEW drive, it also comes with the latest AEM Cores UCS software which is issued on our UCM3000 and UCM425 machines.
